

HandsOn 4

Task 1:

Run EXPLAIN (PostgreSQL) or EXPLAIN FORMAT=JSON (MySQL) on the following query and save the output as a comment in your .sql file: SELECT s.first_name, s.last_name, c.course_name FROM enrollments e JOIN students s ON s.student_id = e.student_id JOIN courses c ON c.course_id = e.course_id WHERE s.enrollment_year = 2022;

```
426
427 -- handson 4
428 • EXPLAIN FORMAT=JSON
429 SELECT s.first_name,
430        s.last_name,
431        c.course_name
432 FROM enrollments e
433 JOIN students s
434     ON s.student_id = e.student_id
435 JOIN courses c
436     ON c.course_id = e.course_id
437 WHERE s.enrollment_year = 2022;
```

49. Identify whether the query plan shows a Sequential Scan (Postgres) or Full Table Scan (MySQL) on any table.

50. Note the estimated cost (PostgreSQL) or rows examined (MySQL) in your comments

```
-- Q49 The query plan shows a Full Table Scan on the students table.
-- This is indicated by access_type = 'ALL'.
```

```
-- Q50 Estimated query cost: 2.10
-- Rows examined for the students table: <value from rows_examined_per_scan>.
```
